

None ← special object
analogous to \emptyset for ints / floats
False for bool
means "nothing"

Use None to indicate a variable has no value

```
def main():  
→ v = None  
→ v = 1.0  
→ v = Point(10, 10)
```

Calling methods on None → error
Performing ops on None → error
To check for None:
if v is not None:
do something
