# CS 43: Computer Networks 

## 21: Intra and Interdomain Routing November 21, 2019

Adapted from Slides by: J.Kurose, D. Choffnes, K. Webb

Reading Quiz

## Network Layer

- Function: Route packets end-to-end on a network, through multiple hops

## Network Layer Functions

- Forwarding: move packets from router's input to appropriate router output
- Look up in a table
- Routing: determine route taken by packets from source to destination.
- Populating the table

## Interplay between routing, forwarding

## Graph Abstraction

$$
\begin{gathered}
c\left(x, x^{\prime}\right)=\text { cost of link }\left(x, x^{\prime}\right) \\
\text { e.g., } c(w, z)=5
\end{gathered}
$$

Cost of path $\left(x_{1}, x_{2}, x_{3}, \ldots, x_{p}\right)=c\left(x_{1}, x_{2}\right)+c\left(x_{2}, x_{3}\right)+\ldots+c\left(x_{p-1}, x_{p}\right)$

Key question: what is the least-cost path between $u$ and $z$ ? Routing algorithm: algorithm that finds that least cost path

## Routing Algorithm Classes

Link State (Global)

- Routers maintain cost of each link in the network.

Distance Vector (Decentralized)

- Routers maintain next hop \& cost of each destination.

## Dijkstra's Algorithm

1 Initialization:
$2 \mathrm{~N}^{\prime}=\{\mathrm{u}\}$
3 for all nodes $v$
4 if $v$ adjacent to $u$
5 then $D(v)=c(u, v)$
6 else $D(v)=\infty$
7
8 Loop
9 find $w$ not in $N^{\prime}$ such that $D(w)$ is a minimum
10 add w to N'
11 update $\mathrm{D}(\mathrm{v})$ for all v adjacent to w and not in $\mathrm{N}^{\prime}$ :
$12 \quad D(v)=\min (D(v), D(w)+c(w, v))$
13 /* new cost to $v$ is either old cost to $v$ or known
14 shortest path cost to $w$ plus cost from w to v */
15 until all nodes in $\mathbf{N}^{\prime}$

Pick the node (w) that isn't already in $\mathrm{N}^{\prime}$ with the shortest distance (least cost path) and add it to $\mathrm{N}^{\prime}$.

Check all possible destinations from w. If going through w gives a lower cost to destination $v$, update $D(v)$.

## Dijkstra's Algorithm - Complexity

- With N nodes and E edges...
- As previously described it's $\mathrm{O}\left(\mathrm{N}^{2}\right)$
- At each step, there are $N$ nodes to choose next
- Total of N steps (each node must be chosen)
- Fastest known is $\mathrm{O}(\mathrm{N} \log \mathrm{N}+\mathrm{E})$
- Uses a min-heap

## Link State - Summary

+ Fast convergence (reacts to events quickly)
+ Small window of inconsistency
- Large number of messages sent on events
- Large routing tables as network size grows

## Intradomain / Intra-AS Routing

## Routing algorithm to find the least-cost path between routers within an Autonomous System

## Intra-AS Routing

- Also known as interior gateway protocols (IGP)

## Goal:

Get traffic that is already in an AS to a destination inside that same AS.

OSPF and IS-IS are deployed most commonly today

## Real Protocols: OSPF vs. IS-IS

$\square$ Two different implementations of link-state routing

## - OSPF

- Favored by companies, datacenters
- More optional features
- Built on top of IPv4
- LSAs are sent via IPv4
- OSPFv3 needed for IPv6
- IS-IS
- Favored by ISPs
- Less "chatty"
- Less network overhead
- Supports more devices
- Not tied to IP
- Works with IPv4 or IPv6

## Different Organizational Structure

## OSPF

- Organized around overlapping areas
- Area 0 is the core network

## IS-IS

- Organized as a 2-level hierarchy
- Level 2 is the backbone

## OSPF (Open Shortest Path First)

- Link state protocol (reliable flooding of LSAs)
- "Open": standardized, publicly available implementations
- Multiple equal-cost paths allowed (load balancing)
- Additional features:
- OSPF messages authenticated (to prevent malicious intrusion)
- Hierarchical OSPF for large autonomous systems.

## Hierarchical OSPF

- Two-level hierarchy: local area, backbone.
- link-state advertisements only in area
- each nodes has detailed area topology; only know direction (shortest path) to nets in other areas.
- Area border routers: "summarize" distances to nets in own area, advertise to other Area Border routers.
- Backbone routers: route between local areas
- Boundary routers: connect to other AS's.

## Hierarchical OSPF

## Routing Algorithm Classes

Link State (Global)

- Routers maintain cost of each link in the network.
- Connectivity/cost changes flooded to all routers.
- Converges quickly (less inconsistency, looping, etc.).

Distance Vector (Decentralized)

- Routers maintain next hop \& cost of each destination.
- Connectivity/cost changes iteratively propagate from neighbor to neighbor.
- Requires multiple rounds to converge.
- Limited network sizes.
- Scales to large networks.

## Bellman-Ford Equation

let

$$
d_{x}(y):=\text { cost of least-cost path from } x \text { to } y
$$

then

$$
d_{x}(y)=\min _{v}\left\{c(x, v)+d_{v}(y)\right\}
$$

cost from neighbor $v$ to destination $y$
$\min$ taken over all neighbors $v$ of $x$

## Distance Vectors

- Let $D_{x}(y)=$ vector of least cost from $x$ to $y$
- Node x:
- Knows cost to each neighbor v: c(x,v)
- Maintains its neighbors' distance vectors. For each neighbor $v, x$ maintains:

$$
D_{v}=\left[D_{v}(y): y \in N\right]
$$

- As opposed to link state:
- Only keeps state for yourself and direct neighbors

## Distance Vector Algorithm

- Periodically, each node sends its own distance vector to neighbors
- Upon receiving new DV from neighbor, update its local DV using B-F equation:
$D_{x}(y) \leftarrow \min _{v}\left\{c(x, v)+D_{v}(y)\right\}$ for each node $y \in N$
- Under typical conditions, $D_{x}(y)$ will converge to the least cost $d_{x}(y)$

## Distance Vector Algorithm

Iterative, asynchronous: Iteration when:

- Local link cost change
- DV update from neighbor
- Periodic timer

Distributed:

- Each node knows only a portion of global link info

## each node:

## Distance Vector Example

- Same network as Dijkstra's example, without node E.
- What l'll show you next is routing table (of distance vectors) at each router.

## Distance Vector - Round 0

Routers populate their forwarding table by taking the row minimum.

| Router A |  |  |
| :---: | :---: | :---: |
| $\begin{gathered} \text { Via } \rightarrow \\ \downarrow \text { To } \end{gathered}$ | B | C |
| B | 5 |  |
| C |  | 2 |
| D |  |  |
| F |  |  |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via |  |  | A |
| B | D |  |  |
| To |  |  |  |

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A |  |  |
| B | 14 |  |
| C |  |  |
| D |  | 5 |

| Router D |  |  |  |
| :---: | :---: | :---: | :---: |
| Via |  | B | C |
| ע To |  |  |  |
| A |  |  |  |
| B | 2 |  |  |
| C |  | 4 |  |
| F |  | 5 |  |

## Distance Vector - Round 0

Router exchange their local vectors with direct neighbors. We'll assume they all exchange at once (synchronous). (Not realistic)

$\left.$| Router A |  |  |
| :---: | :---: | :---: |
| Via | B | C |
| $\downarrow$ To |  |  |$n \right\rvert\,$| B | 5 |
| :---: | :---: |
| C |  |
| D |  |
| F |  |

| Router B |  |  |  |
| :---: | :---: | :---: | :---: |
| Via $\rightarrow$ |  |  | A |
| \& | D | F |  |
| A |  |  |  |
| C |  | 1 |  |
| D |  |  |  |
| F |  |  |  |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via $\rightarrow$ |  |  | A |
| \& | D |  |  |
| To |  |  |  |
| A | 2 |  |  |
| B |  | 1 |  |
| D |  |  | 4 |
| F |  |  |  |

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A |  |  |
| B | 14 |  |
| C |  |  |
| D |  | 5 |

| Router D |  |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | B | C | F |
| A |  |  |  |
| B | 2 |  |  |
| C |  | 4 |  |
| F |  |  | 5 |

## Distance Vector - Round 1

Router F

A will send to neighbors ( $B \& C$ ): $I$ can get to $B$ in 5 and $C$ in 2.

| Router A |  |  |
| :---: | :---: | :---: |
| $\begin{gathered} \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | B | c |
| B | 5 |  |
| C |  | 2 |
| D |  |  |
| F |  |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 |  |  |  |
| C | 7 | 1 |  |  |
| D |  |  | 2 |  |
| F |  |  |  | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via <br> ע To |  |  | A |
|  | B | D |  |
| A | 2 |  |  |
| B | 7 | 1 |  |
| D |  |  | 4 |
| F |  |  |  |

Router D

| Via <br> $\downarrow$ To | B | C | F |
| :---: | :---: | :---: | :---: |
| A |  |  |  |
| B | 2 |  |  |
| C |  | 4 |  |
| F |  | 5 |  |

## Distance Vector - Round 1

Router F

$B$ will send to neighbors ( $A, C, D, F$ ): I can get to $A$ in $5, C$ in $1, D$ in 2 , and $F$ in 14.

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 |  |
| C | 6 | 2 |
| D | 7 |  |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | C | D | F |
| A | 5 |  |  |  |
| C | 7 | 1 |  |  |
| D |  |  | 2 |  |
| F |  |  |  | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | B | D |
| A | 2 | 6 |  |
| B | 7 | 1 |  |
| D |  | 3 | 4 |
| F |  | 15 |  |

Router D

| Via <br> $\downarrow$ To | B | C | F |
| :---: | :---: | :---: | :---: |
| A | 7 |  |  |
| B | 2 |  |  |
| C | 3 | 4 |  |
| F | 16 | 5 |  |

## Distance Vector - Round 1

Router F

$C$ will send to neighbors ( $A, B, D$ ): $I$ can get to $A$ in $2, B$ in 1 , and $D$ in 4.

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> $\downarrow ~ T o ~$ | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | C | D | F |
| A | 5 | 3 |  |  |
| C | 7 | 1 |  |  |
| D |  | 5 | 2 |  |
| F |  |  |  | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via A B D <br> ע To    |  |  |  |
| A | 2 | 6 |  |
| B | 7 | 1 |  |
| D |  | 3 | 4 |
| F |  | 15 |  |

Router D

| Via <br> Vo | B | C | F |
| :---: | :---: | :---: | :---: |
| A | 7 | 6 |  |
| B | 2 | 5 |  |
| C | 3 | 4 |  |
| F | 16 | 5 |  |

## Distance Vector - Round 1

Router F

$D$ will send to neighbors ( $B, C, F$ ): $I$ can get to $B$ in $2, C$ in 4 , and $F$ in 5 .

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \text { Via } \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | C | D | F |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 |  |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | B | D |
| A | 2 | 6 |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 15 | 9 |

Router D

| Via <br> ل To | B | C | F |
| :---: | :---: | :---: | :---: |
| A | 7 | 6 |  |
| B | 2 | 5 |  |
| C | 3 | 4 |  |
| F | 16 | 5 |  |

## Distance Vector - Round 1

$F$ will send to neighbors ( $B, D$ ): I can get to $B$ in $14, D$ in 5 .

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> $\downarrow ~ T o ~$ | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 | 19 |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via <br> ل To | A | B | D |
| A | 2 | 6 |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 15 | 9 |

| Router D |  |  |  |
| :---: | :---: | :---: | :---: |
| Via $\rightarrow$ | B | C | F |
| To |  |  |  |

At the end of round 1 , how many routers need to update their forwarding tables?

Router F

$A-1, B-2, C-3, D-4, E-5$

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 | 19 |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via <br> ע To | A | B | D |
| A | 2 | 6 |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 15 | 9 |

| Via <br> To B C | F |  |  |
| :---: | :---: | :---: | :---: |
| A | 7 | 6 |  |
| B | 2 | 5 | 19 |
| C | 3 | 4 |  |
| F | 16 |  | 5 |

## Distance Vector - Round 2

Each router advertises the best cost it has to each destination.
Router F

Nothing new to learn from A or F, so we'll skip their announcements.

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A | 19 |  |
| B | 14 | 7 |
| C | 15 | 9 |
| D | 16 | 5 |

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 19 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 | 19 |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via <br> \& To | A | B | D |
| A | 2 | 6 |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 15 | 9 |

| Router D |  |  |  |
| :---: | :---: | :---: | :---: |
| Via | B | C | F |
| ע To |  |  |  |

## Distance Vector - Round 2

Router F

$B$ will send to neighbors ( $A, C, D, F$ ):

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A | 17 |  |
| B | 14 | 7 |
| C | 15 | 9 |
| D | 16 | 5 | I can get to $A$ in $3, C$ in $1, D$ in 2 , and $F$ in 7.

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> $\downarrow ~ T o ~$ | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 12 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 | 19 |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ <br> To | A | B | D |
| A | 2 | $4 ?$ |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 8 | 9 |

| Router D |  |  |  |
| :---: | :---: | :---: | :---: |
| Via $\rightarrow$ | B | C | F |
| $\downarrow$ To |  |  |  |

## Distance Vector - Round 2

$C$ will send to neighbors ( $A, B, D$ ):

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A | 17 |  |
| B | 14 | 7 |
| C | 15 | 9 |
| D | 16 | 5 | I can get to $A$ in $2, B$ in $1, D$ in 3 , and $F$ in 9 .

| Router A |  |  | Router B |  |  |  |  | Router C |  |  |  | Router D |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \mathrm{To} \end{gathered}$ | B | C | $\begin{gathered} \quad \mathrm{Via} \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A | C | D | F | $\xrightarrow{\text { Via } \rightarrow}$ | A | B | D | $\stackrel{\text { Via }}{\downarrow}$ | B | C | F |
| B | 5 | 3 | A | 5 | 3 |  |  | A | 2 | 4? |  | A | 5 | 6 |  |
| C | 6 | 2 | C | 7 | 1 | 6 |  | B | 7 | 1 | 6 | B | 2 | 5 | 19 |
| D | 7 | 5 | D |  | 4? | 2 | 19 | D |  | 3 | 4 | C | 3 | 4 |  |
| F | 12 | 11 | F |  | 10 | 7 | 14 | F |  | 8 | 9 | F | 9 ? | 13 ? | 5 |

## Distance Vector - Round 2

This process repeats for a while...

Router F

| Via <br> $\downarrow$ To | B | D |
| :---: | :---: | :---: |
| A | 17 |  |
| B | 14 | 7 |
| C | 15 | 9 |
| D | 16 | 5 |

Router D

| $\begin{gathered} \mathrm{Via} \rightarrow \\ \downarrow \mathrm{To} \end{gathered}$ | A | C | D | F | $\begin{gathered} \stackrel{\text { Via }}{\rightarrow} \\ \downarrow \text { To } \end{gathered}$ | A | B | D | $\begin{gathered} \quad \text { Via } \rightarrow \\ \downarrow \text { To } \end{gathered}$ | B | C | F |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | 5 | 3 |  |  | A | 2 | 4? |  | A | 5 | 6 |  |
| C | 7 | 1 | 6 |  | B | 7 | 1 | 6 | B | 2 | 5 | 19 |

## Rewind: Distance Vector - Round 2

$B$ will send to neighbors ( $A, C, D, F$ ): I can get to $A$ in $3, C$ in $1, D$ in 2 , and $F$ in 7.

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 12 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via <br> $\downarrow$ To |  |  | A | C |
| D | F |  |  |  |
| A | 5 | 3 |  |  |
| C | 7 | 1 | 6 |  |
| D |  | 5 | 2 | 19 |
| F |  |  | 7 | 14 |

| Router C |  |  |  |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \quad \mathrm{Via} \rightarrow \\ & \downarrow \text { To } \end{aligned}$ | A | B | D |
| A | 2 | 4? |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 8 | 9 |

| Via <br> To | B | C | F |
| :---: | :---: | :---: | :---: |
| A | 5 | 6 |  |
| B | 2 | 5 | 19 |
| C | 3 | 4 |  |
| F | $9 ?$ |  | 5 |

## Rewind: Distance Vector - Round 2

Poisoned reverse: Don't advertise a lower value to a neighbor if you go through that neighbor to get there!

| Router A |  |  |
| :---: | :---: | :---: |
| Via $\rightarrow$ <br> To | B | C |
| B | 5 | 3 |
| C | 6 | 2 |
| D | 7 | 6 |
| F | 12 |  |

| Router B |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Via $\rightarrow$ | A | C | D | F |
| $\downarrow$ To |  |  |  |  |

| $\begin{gathered} \text { Via } \rightarrow \\ \downarrow \text { To } \end{gathered}$ | A |  |  |
| :---: | :---: | :---: | :---: |
| A | 2 | 4 ? |  |
| B | 7 | 1 | 6 |
| D |  | 3 | 4 |
| F |  | 8 | 9 |

| Via <br> $\downarrow$ To | B | C | F |
| :---: | :---: | :---: | :---: |
| A | 5 | 6 |  |
| B | 2 | 5 | 19 |
| C | 3 | 4 |  |
| F | $9 ?$ |  | 5 |

## Loop-prevention

- Route poisoning helps prevent loops, but doesn't guarantee loop free.
- Other mechanisms help too
- There will always be a window of vulnerability

## Summary

## Link State

+ Fast convergence (reacts to events quickly)
+ Small window of inconsistency
- Large number of messages sent on events
- Large routing tables as network size grows

## Distance Vector

+ Distributed (small tables)
+ No flooding (fewer messages)
- Slower convergence
- Larger window of inconsistency

## Real Protocols

## Link State

- Open Shortest Path First (OSPF)
- Intermediate system to intermediate system (IS-IS)

## Distance Vector

- Routing Information Protocol (RIP)
- Interior Gateway Routing Protocol (IGRP - Cisco)
- Border Gateway Protocol (BGP) (sort of)

## Internet/inter-AS Routing

## Goal:

Get traffic from one AS to another.

## Inter-Domain Routing

- Global connectivity is at stake!
- Thus, all ASs must use the same protocol
- Contrast with intra-domain routing
- What are the requirements?
- Scalability
- Flexibility in choosing routes
- Cost
- Routing around failures
- Question: link state or distance vector?
- Trick question: BGP is a path vector protocol

Hierarchical routing: Autonomous Systems

## Hierarchical routing

- We aggregate routers into regions,
"autonomous systems" (AS)
- Routers in same AS run same routing protocol
- "intra-AS" or "interior" routing protocol
- routers in different AS can run different intra-AS routing protocol

Gateway (or border) router:

- at "edge" of its own AS
- has link to router in another AS

Hierarchical routing: Interconnected ASes

## Tier-1 ISP Peering

AS-level Topology 2003 Source: CAIDA

Peering: OutDegree

## Inter-domain (Inter-ISP) Routing

Suppose router in AS2 receives a datagram destined outside of AS2:

- Router should forward packet to gateway router, but which one?

## Inter-domain (Inter-ISP) Routing

AS2 must:

1. Learn destinations reachable through AS2
2. Propagate this reachability info to all routers in AS2

AS 4

AS 1

## Path Vector Protocol

- Key idea: advertise the entire path
- Distance vector: send distance metric per dest d
- Path vector: send the entire path for each dest d

AS 1

## Path Vector Protocol

- AS-path: sequence of ASs a route traverses
- Like distance vector, plus additional information
- Used for loop detection and to apply policy
- Default choice: route with fewest \# of ASs

```
120.10.0.0/16: AS 1
130.10.0.0/16: AS 3 > AS 4
110.10.0.0/16: AS 2 }->\mathrm{ AS 5
```

If an external destination is reachable from multiple gateways, a router inside the AS should forward packets for that destination to...
A. The closest gateway that can reach the destination.
B. The gateway that has the least-cost external path to the destination.
C. The gateway that has the least-cost path for both the internal and external path.
D. Somewhere else.

Building the forwarding table in router 2d, for path to AS 5

AS2 learns (Inter-AS) protocol that AS5 is reachable through AS3 (via gateway 2b)

## AS 4

AS 5

## 1a AS 1

Router 2d learns (intra-AS) protocol least cost path to 2b (on it's interface facing right: R)

Building the forwarding table in router 2d, for path to AS 5

Router 2d learns (intra-AS) protocol least cost path to 2 b (on it's interface facing right: R)

## AS 4

Why do we need different Intra and Interdomain AS routing?
A. Scalability
B. Performance
C. A and B
D. More than just $A$ and $B$

## Routing Policy

- How should the ISP route the customer's traffic to the destination?

Which routes a BGP router advertises will depend on...
A. which ISPs have contractual agreements.
B. the shortest path to a subnet/prefix.
C. which subnets are customers of an ISP.
D. More than one of the above. (which?)

## BGP Relationships

## Peering/Interconnection Wars

- Peer
- Reduce upstream costs
- Improve end-to-end performance
- May be the only way to connect to parts of the Internet
- Don't Peer
- You would rather have customers
- Peers are often competitors
- Peering agreements require periodic renegotiation

## Peering struggles in the ISP world are extremely contentious, agreements are usually confidential

Border routers: exchange AS reachability, Internal routers: exchange intra-AS reachability., Is this sufficient to route from source to destination?

## Internet inter-AS routing: BGP

## Internet inter-AS routing: BGP

- Question: why do we need iBGP?
- OSPF does not include BGP policy info
- Prevents routing loops within the AS
- iBGP updates do not trigger announcements

## Internet inter-AS routing: BGP

- BGP (Border Gateway Protocol):

The de facto inter-domain routing protocol

- BGP provides each AS a means to:
- external BGP: obtain subnet reachability information from neighboring ASs.
- internal BGP: propagate reachability information to all AS-internal routers.
- determine "good" routes to other networks based on reachability information and policy.
- Allows a subnet to advertise its prefix to the rest of the Internet

## Shortest AS Path != Shortest Path

## Hot Potato Routing: get rid of packets

 ASAP!

## Route Selection Summary

Highest Local Preference

## Enforce relationships

Shortest AS Path
Lowest MED
Traffic engineering
Lowest IGP Cost to BGP Egress

Lowest Router ID
When all else fails,
break ties

## BGP routing policy

legend:

customer network:

- A,B,C are provider networks
- X,W,Y are customer (of provider networks)
- X is dual-homed: attached to two networks
- X does not want to route from $B$ via $X$ to $C$ - .. so X will not advertise to B a route to C

## BGP routing policy (2)

customer
network:

- A advertises path AW to B
- B advertises path BAW to X
- Should B advertise path BAW to C?
- B gets no "revenue" for routing CBAW since neither $W$ nor $C$ are B's customers
- B wants to force C to route to w via A
- B wants to route only to/from its customers!

## BGP routing policy gone wrong

customer
network:

- $x$ advertises a path to $E$ (that it is not connected to).
- all traffic starts to flow into $x$ from $B$ and $C$ !

## Faulty redistribution can be dangerous!

- AS7007 incident (April, 1997):

## Summary

- As we've seen before (DNS), a hierarchy can help manage state storage constraints.
- intra-AS routing: lots of info about local routes
- inter-AS routing: less info about far away routes
- BGP: the inter-AS routing protocol for the Internet
- Decisions often contractual
- BGP advertises AS prefixes, including:
- entire path of ASes along the way
- which border router heard the advertisement (Next Hop)

## Inter-Domain Routing Challenges

- BGP4 is the only inter-domain routing protocol currently in use world-wide
- Issues?
- Lack of security
- Ease of misconfiguration
- Poorly understood interaction between local policies
- Poor convergence
- Lack of appropriate information hiding
- Non-determinism
- Poor overload behavior

## Lots of research into how to fix this

- Security
- BGPSEC, RPKI
- Misconfigurations, inflexible policy
- SDN
- Policy Interactions
- PoiRoot (root cause analysis)
- Convergence
- Consensus Routing
- Inconsistent behavior
- LIFEGUARD, among others

## Why are these still issues?

- Backward compatibility
- Buy-in / incentives for operators
- Stubbornness

## Very similar issues to IPv6 deployment

## Why Network Reliability Remains Hard

- Visibility
- IP provides no built-in monitoring
- Economic disincentives to share information publicly
- Control
- Routing protocols optimize for policy, not reliability
- Outage affecting your traffic may be caused by distant network
- Detecting, isolating and repairing network problems for Internet paths remains largely a slow, manual process
