

# CS 88: Security and Privacy

09: Web Security: HTTP and Cookies

09-27-2022

slides adapted from Dave Levine, Vitaly Shmatikov, Christo Wilson

# Reading Quiz

# Announcements

- Midterm Exam on October 3<sup>rd</sup>
  - 1-2.30pm and at 4 - 5.30pm @ SCI 199
  - Review in Class on Thursday
  - Dunkin Donuts + Coffee!
  - Accommodations: not informed me? do so TODAY!!!
- Thanks for your feedback last week!
  - 50%: Flipped classroom: Yay! 50%: Flipped classroom: No!
  - First upper-level G2 for majority of the class
  - Flipped on Tuesday
  - Content on Thursday + 10 minutes of ask anything!
    - Everything will be recorded
  - Solutions to worksheets: up today on Edstem
  - Feedback is important!

# SQL Injection

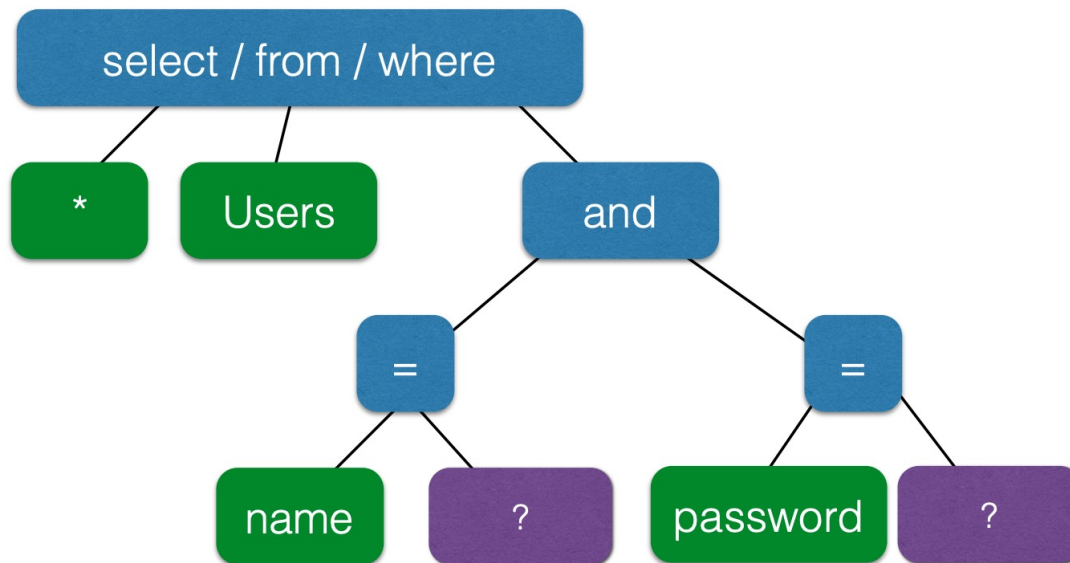

A screenshot of a web application's login interface. It features a 'Username:' label followed by an input field, a 'Password:' label followed by an input field, a checkbox labeled 'Log me on automatically each visit', and a 'Log in' button. A dotted line connects the password input field to a callout box below it. The callout box contains the SQL injection payload: `'spongebob' or 1=1); DROP TABLE Users; #`.

```
$result = mysql_query("select * from Users  
    where(name='$user' and password='$pass');");  
  
$result = mysql_query("select * from Users  
    where(name='spongebob' or 1=1);#  
    DROP TABLE Users; --  
    ' and password='whocares');");
```

Can chain together statements, and can modify existing statements

# The underlying issue

```
$statement = $db->prepare("select * from Users  
where(name=? and password=?);");
```

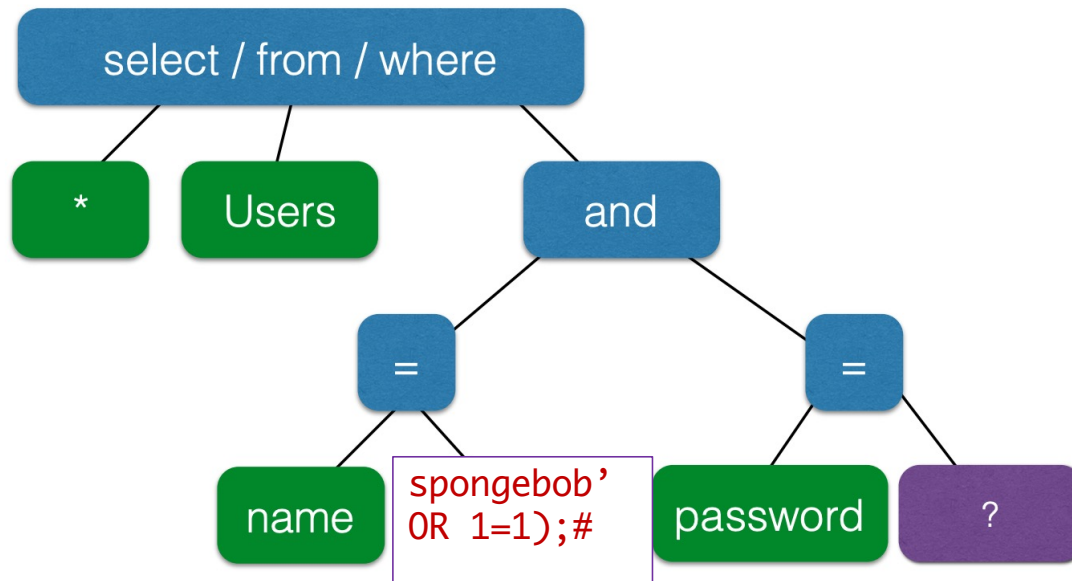

Prepare is only applied to the leaves, so the structure of the tree is fixed.

- Parametrized SQL statement.
- compile the query first
  - plug inputs later

# The underlying issue

```
$statement = $db->prepare("select * from Users  
where(name=? and password=?);");
```

Prepare is only applied to the leaves, so the structure of the tree is fixed.

# Not Just SQL!

*Injection vulnerabilities are a generic issue!*

# PREVENTING INJECTION ATTACKS

*validate all the inputs!*

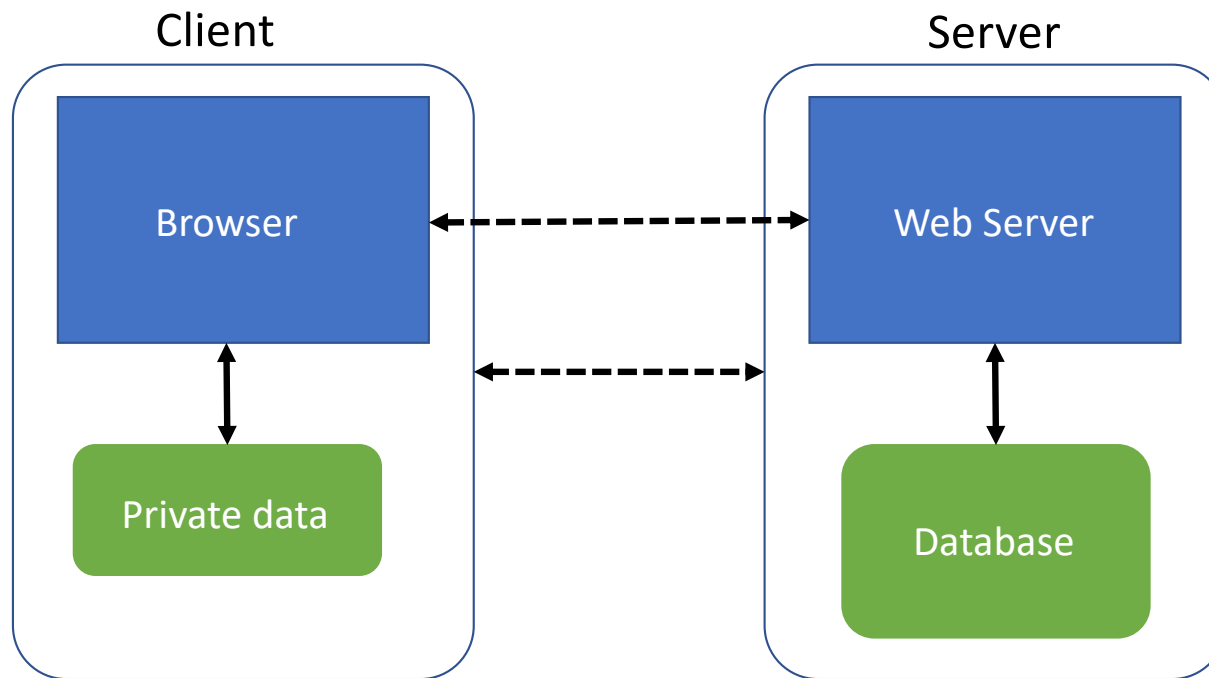

Most injection attacks trick application into **interpreting data as code**

This changes the semantics of a query or command generated by the application

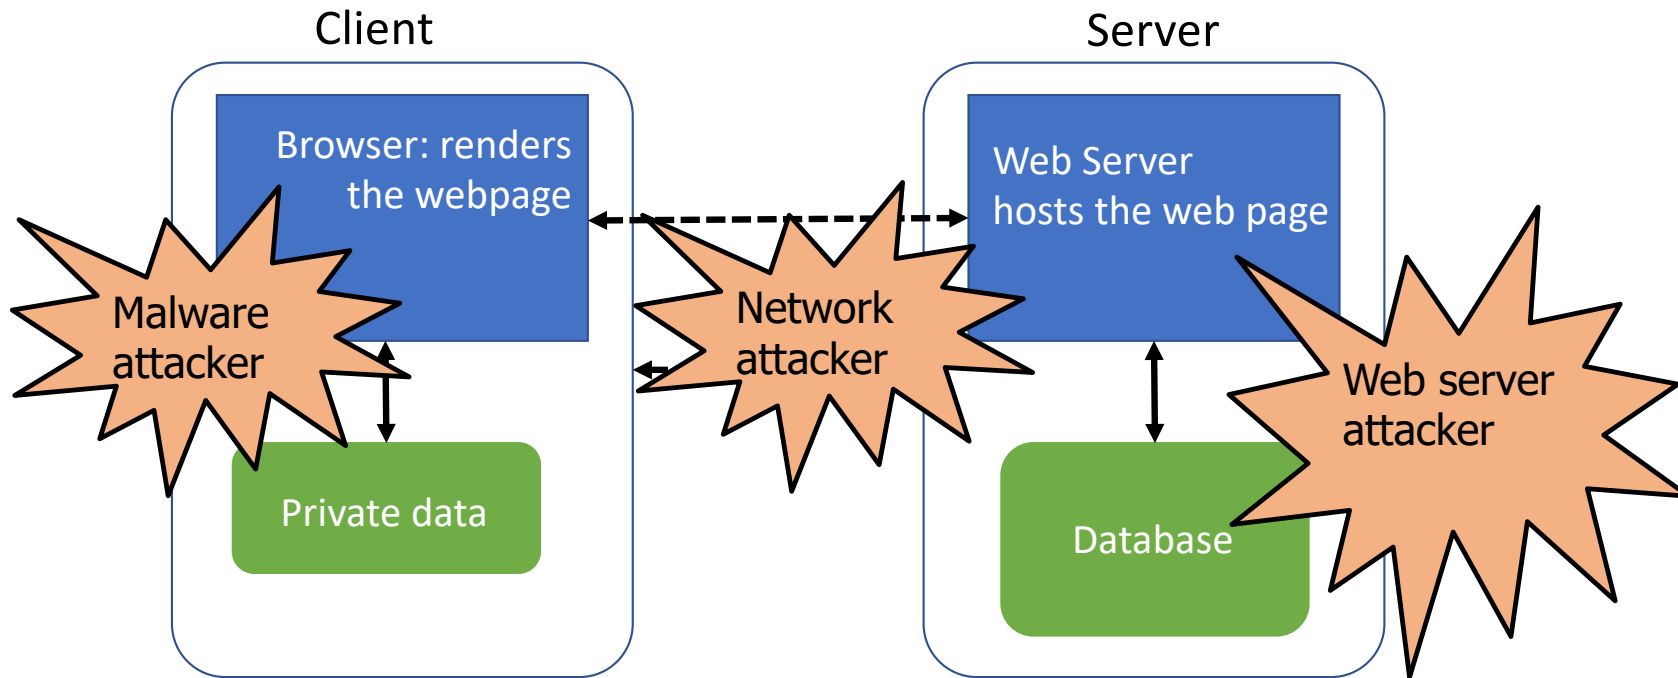

# A basic web architecture

**Much of the user data is part of the browser**

**DB is a separate entity, logically (and often physically)**

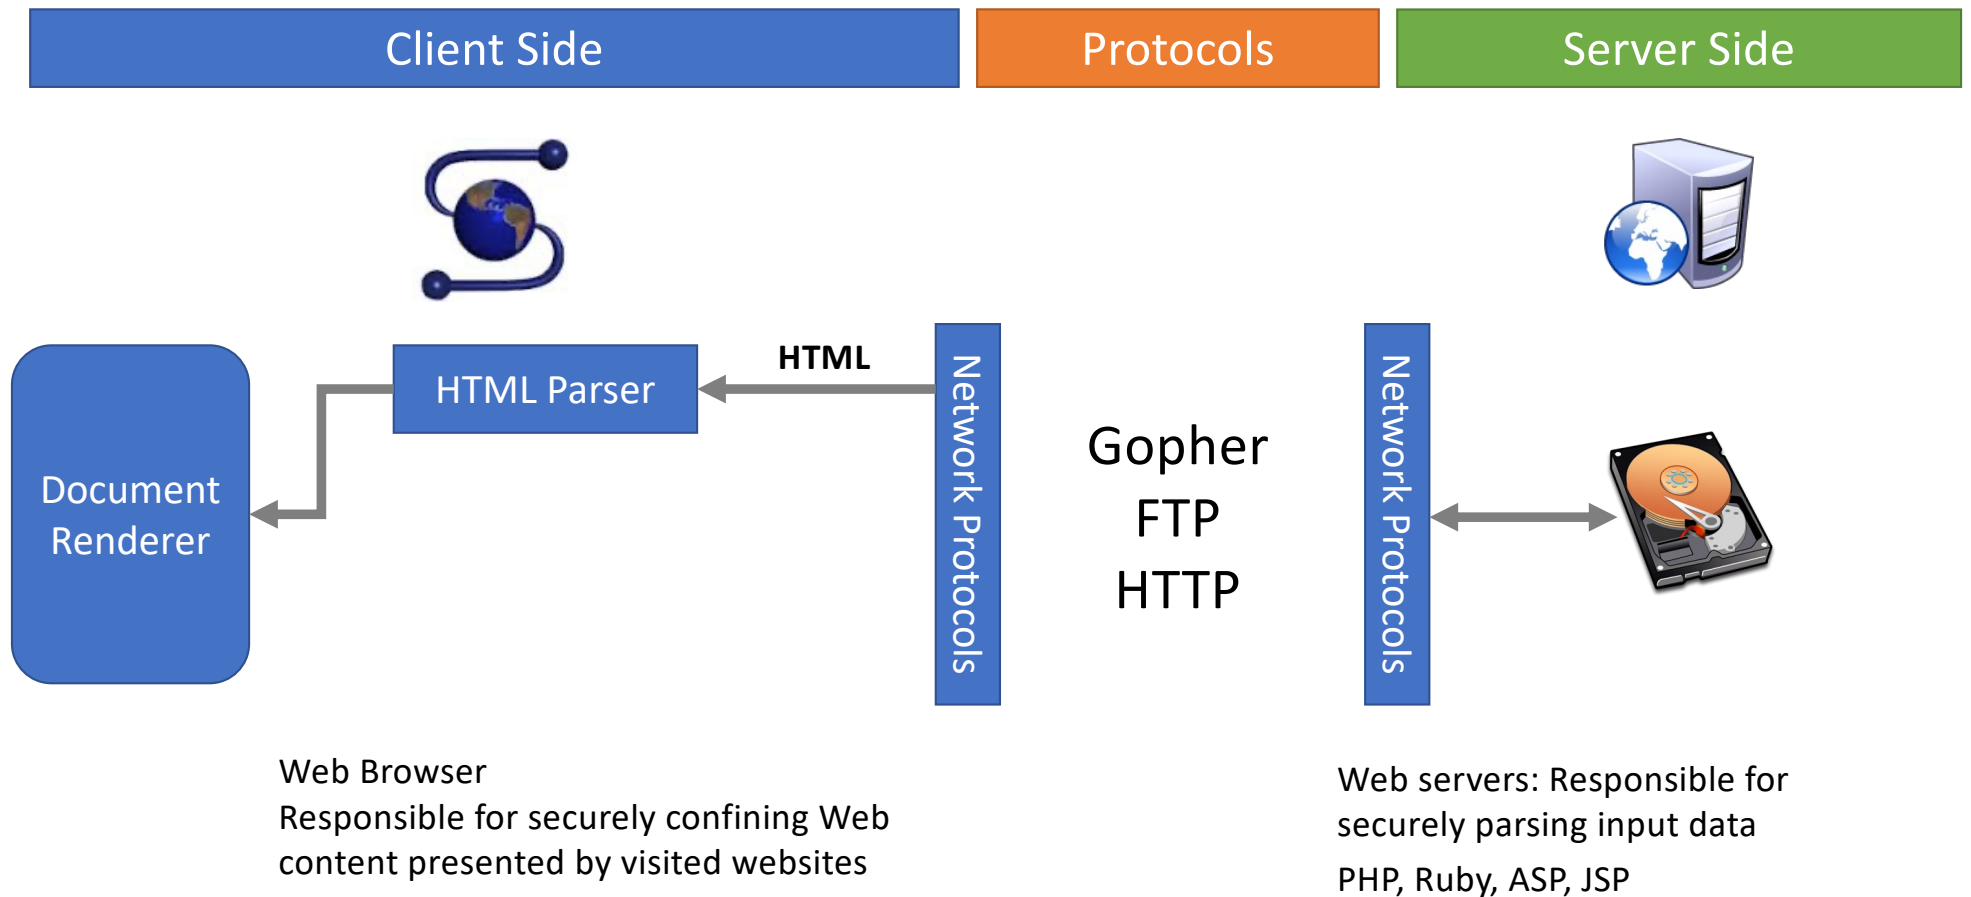

# Where Does the Attacker Live?

**Much of the user data is part of the browser**

**DB is a separate entity, logically (and often physically)**

# Web Architecture: Simplified View

# Overview

- The Web Model
  - What components make up today's browsers and web servers?
  - How has this functionality evolved over time?
  - What security model governs the browser?
- Attacks Against Clients
  - Cross Site Scripting (XSS) and Response Splitting
  - Cross Site Request Forgery (CSRF)
  - Clickjacking
- Attacks Against Servers
  - SQL Injection
  - Unrestricted Uploads
  - CGI shell injection

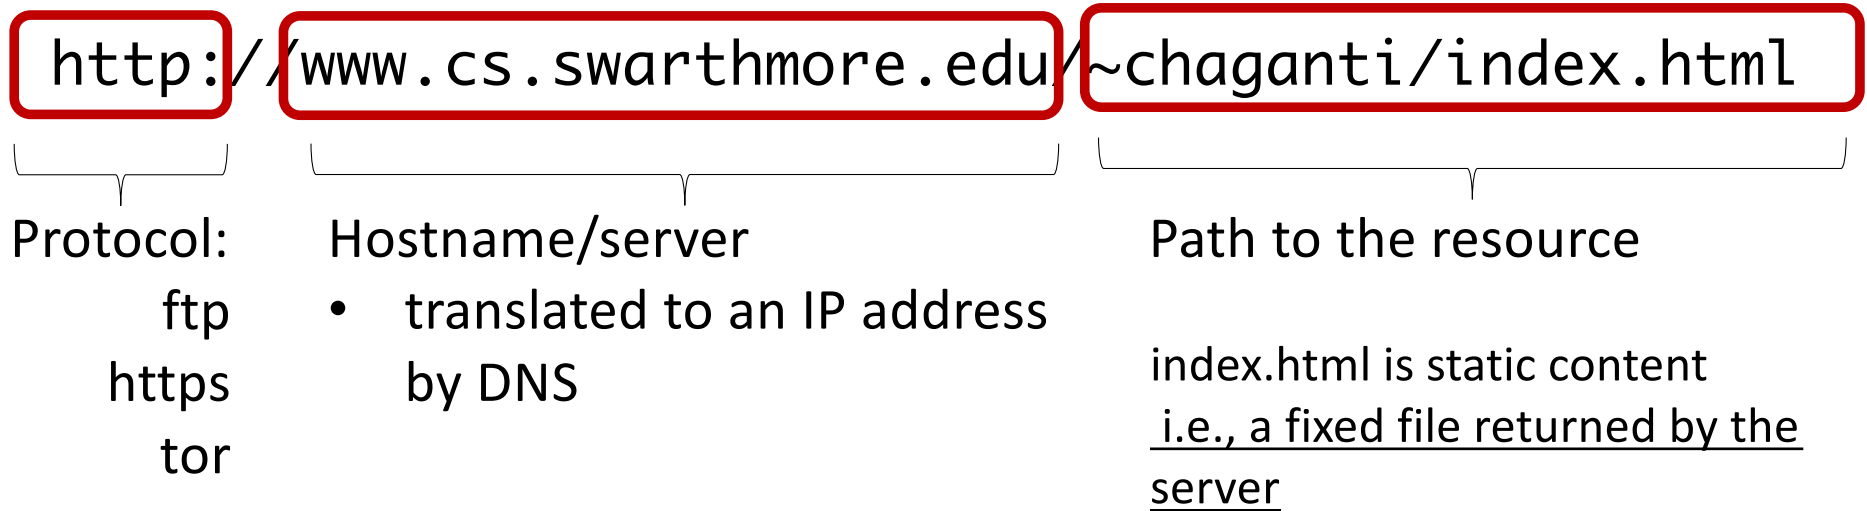

# What is the web?

- **Web (World Wide Web):** A collection of data and services
  - Data and services are provided by **web servers**
  - Data and services are accessed using **web browsers** (e.g. Chrome, Firefox)
- The web is not the Internet
  - The Internet describes *how* data is transported between servers and browsers

# Elements of the Web

- URLs: How do we uniquely identify a piece of data on the web?
- HTTP: How do web browsers communicate with web servers?
- Data on the webpage can contain:
  - HTML: A markup language for static webpages
  - CSS: A style sheet language for defining the appearance of webpages
  - Javascript: a programming language for running code in the web browser

# Interacting with web servers

## Interacting with web servers: dynamic content

`http://facebook.com/delete.php` Path to the resource

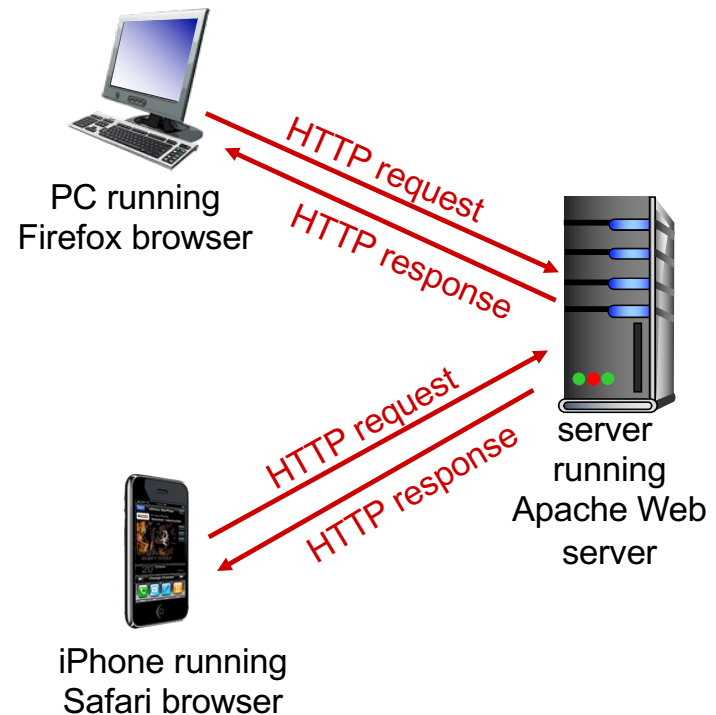

`http://facebook.com/delete.php?f=eva264&w=16`

arguments

server generates the content on the fly

# HTTP: Hypertext transfer protocol

- client/server model
  - **client:** browser that requests, receives, (using HTTP protocol) and “displays” Web objects
  - **server:** Web server sends (using HTTP protocol) objects in response to requests

# HTTP Overview

## 1. User types in a URL.

`http://some.host.name.tld/directory/name/file.ext`

host name

path name

# HTTP Overview

2. Browser establishes connection with server.  
Looks up “some.host.name.tld”  
connects //more on this later

# HTTP Overview

### 3. Browser requests the corresponding data.

GET /directory/name/file.ext HTTP/1.0

Host: some.host.name.tld

[other optional fields, for example:]

User-agent: Mozilla/5.0 (Windows NT 6.1; WOW64)

Accept-language: en

# HTTP Overview

## 4. Server responds with the requested data.

HTTP/1.0 200 OK

Content-Type: text/html

Content-Length: 1299

Date: Sun, 01 Sep 2013 21:26:38 GMT

[Blank line]

(Data data data data...)

# HTTP Overview

5. Browser renders the response, fetches any additional objects, and closes the connection.

# HTTP Methods

**GET:** Get the resource at the specified URL (does not accept message body)

**POST:** Create new resource at URL with payload

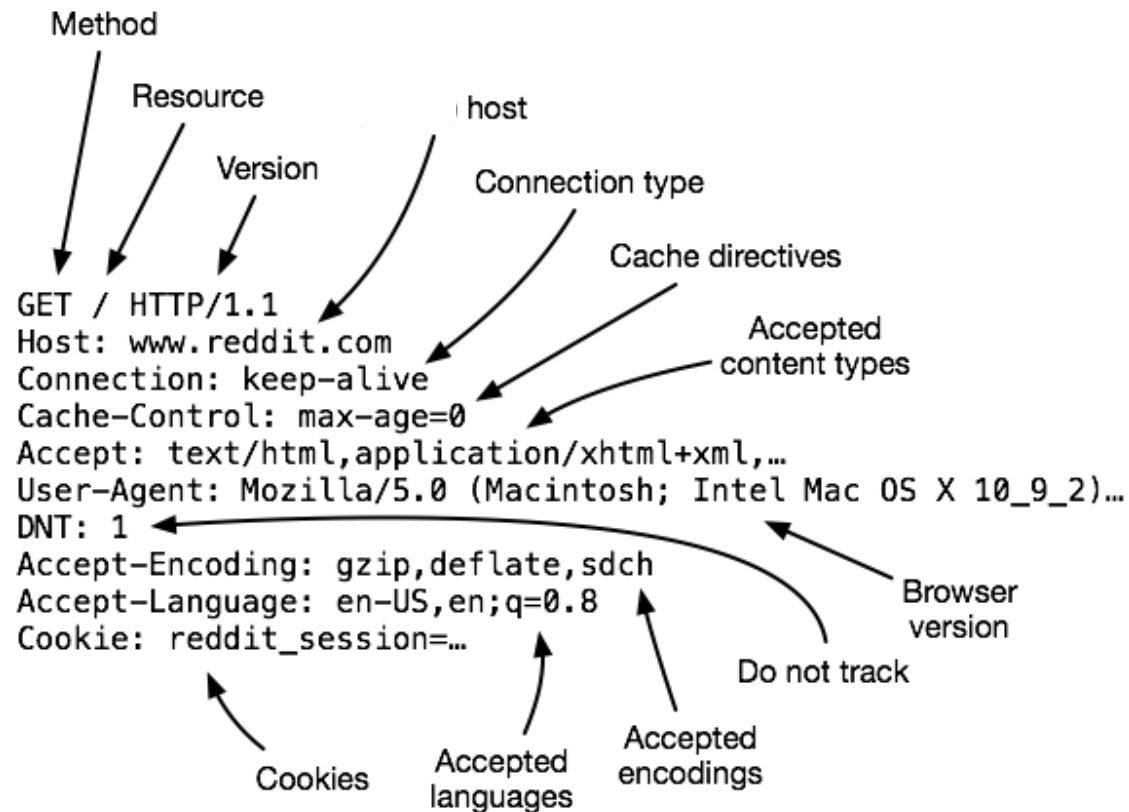

**PUT:** Replace target resource with request payload

**PATCH:** Update part of the resource

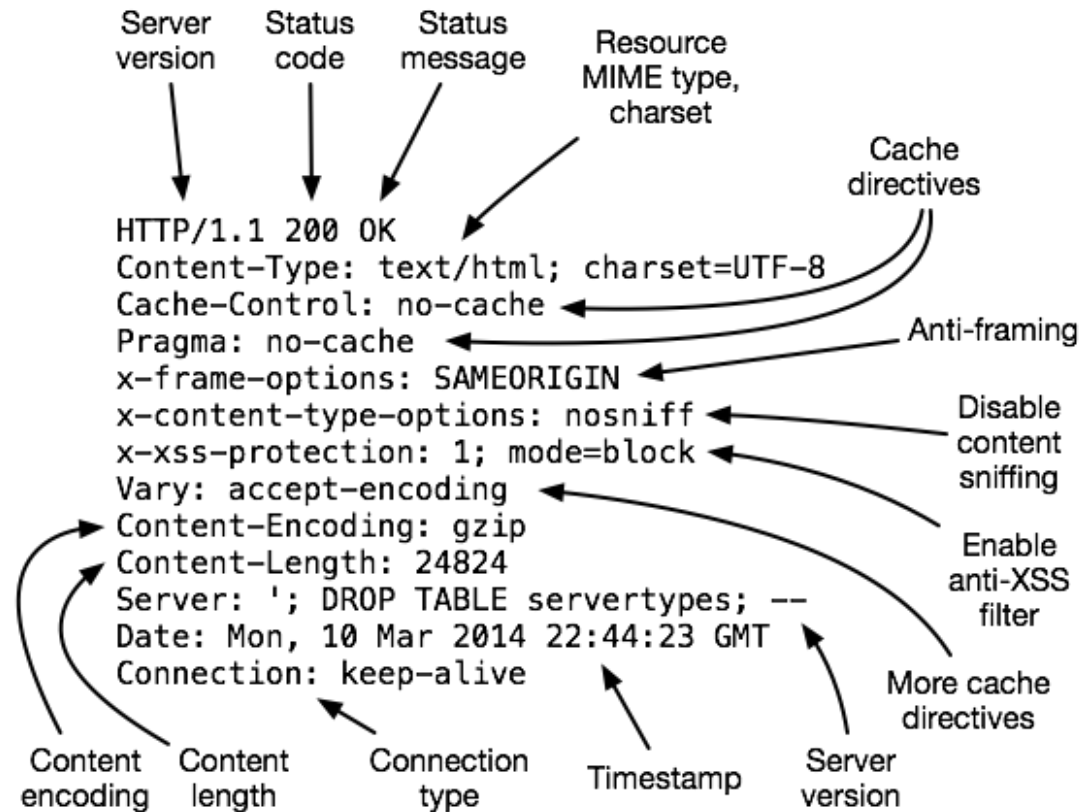

**DELETE:** Delete the specified URL

# HTTP Request Header

# HTTP Response Header

# Example

GET / HTTP/1.1

Host: demo.cs.swarthmore.edu

HTTP/1.1 200 OK

Vary: Accept-Encoding

Content-Type: text/html

Accept-Ranges: bytes

ETag: "316912886"

Last-Modified: Wed, 04 Jan 2017 17:47:31 GMT

Content-Length: 1062

Date: Wed, 05 Sep 2018 17:27:34 GMT

Server: lighttpd/1.4.35

Response  
headers

Response Body

# Example

GET / HTTP/1.1

Host: demo.cs.swarthmore.edu

Response Headers

```
<html><head><title>Demo Server</title></head>  
<body>  
.....  
</body>  
</html>
```

Response  
Body

## Discussion Question: HTTP Extensible Headers

The Swarthmore IT department decides to come up with a new header field `Trusted_Source` in HTTP response fields. This field is used to tag all websites that have swarthmore as the origin, as trusted. How can swarthmore ensure deployability? Can this scheme be subverted by a malicious user?

```
GET /directory/name/file.ext HTTP/1.0
Host: some.host.name.tld
[other optional fields, for example:]
User-agent: Mozilla/5.0 (Windows NT 6.1; WOW64)
Accept-language: en
Referer: http://google.com?q=swarthmore.edu
```

```
HTTP/1.0 200 OK
Content-Type: text/html
Content-Length: 1299
Date: Sun, 01 Sep 2013 21:26:38 GMT
Trusted_Source = Yes
[Blank line]
(Data data data data...)
```

- A. Cannot be deployed, hence cannot be subverted.
- B. Can be deployed, cannot be subverted
- C. Can be deployed, can be subverted
- D. Hard to deploy, can be subverted.

# State(less)

(XKCD #869, "Server Attention Span")

# What Are Cookies Used For?

- Authentication
  - The cookie proves to the website that the client previously authenticated correctly
- Personalization
  - Helps the website recognize the user from a previous visit
- Tracking
  - Follow the user from site to site;
  - Read about iPads on CNN and see ads on Amazon 🤖
  - How can an advertiser (A) know what you did on another site (S)?

# Cookies are key-value pairs

Set-Cookie: **key**=**value**; **options**; .....

**Headers**

```
HTTP/1.1 200 OK
Date: Tue, 18 Feb 2014 08:20:34 GMT
Server: Apache
Set-Cookie: session-zdnet-production=6bhqca1i0cbciagu11sisac2p3; path=/; domain=zdnet.com
Set-Cookie: zdregion=MTI5LjUuMTI5LjE1Mzp1czp1czpjZDZmNWY5YTdkODU1N2Q2YzM5NGU3M2Y1ZTRmN0
Set-Cookie: zdregion=MTI5LjUuMTI5LjE1Mzp1czp1czpjZDZmNWY5YTdkODU1N2Q2YzM5NGU3M2Y1ZTRmN0
Set-Cookie: edition=us; expires=Wed, 18-Feb-2015 08:20:34 GMT; path=/; domain=.zdnet.com
Set-Cookie: session-zdnet-production=59ob97fpinqe4bg6lde4dvvq11; path=/; domain=zdnet.com
Set-Cookie: user_agent=desktop
Set-Cookie: zdnet_ad_session=f
Set-Cookie: firstpg=0
Expires: Thu, 19 Nov 1981 08:52:00 GMT
Cache-Control: no-store, no-cache, must-revalidate, post-check=0, pre-check=0
Pragma: no-cache
X-UA-Compatible: IE=edge,chrome=1
Vary: Accept-Encoding
Content-Encoding: gzip
Content-Length: 18922
Keep-Alive: timeout=70, max=146
Connection: Keep-Alive
Content-Type: text/html; charset=UTF-8
```

**Data**

```
<html> ..... </html>
```

# Cookies

Set-Cookie: edition=us; expires=Wed, 18-Feb-2015 08:20:34 GMT; path=/; domain=.zdnet.com

## **Semantics**

- Store "us" under the key "edition" (think of it like one big hash table)

# Cookies

Set-Cookie: `edition=us; expires=Wed, 18-Feb-2015 08:20:34 GMT; path=/; domain=.zdnet.com`

## Semantics

- Store "us" under the key "edition" (think of it like one big hash table)
- This value is no good as of Wed Feb 18...

# Cookies

Set-Cookie: `edition=us`; `expires=Wed, 18-Feb-2015 08:20:34 GMT`; `path=/`; `domain=.zdnet.com`

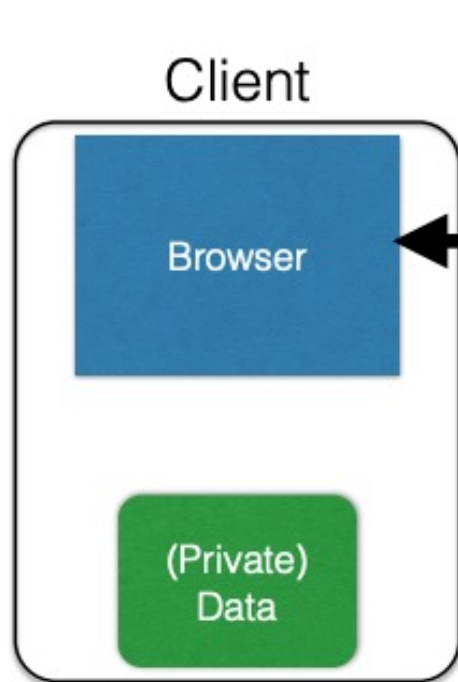

## Semantics

- Store "us" under the key "edition" (think of it like one big hash table)
- This value is no good as of Wed Feb 18...
- This value should only be readable by any domain ending in `.zdnet.com`

# Cookies

Set-Cookie: `edition=us`; `expires=Wed, 18-Feb-2015 08:20:34 GMT`; `path=/`; `domain=.zdnnet.com`

## Semantics

- Store "us" under the key "edition" (think of it like one big hash table)
- This value is no good as of Wed Feb 18...
- This value should only be readable by any domain ending in `.zdnnet.com`
- This should be available to any resource within a subdirectory of /

# Cookies

Set-Cookie: `edition=us`; `expires=Wed, 18-Feb-2015 08:20:34 GMT`; `path=/`; `domain=.zdnnet.com`

## Semantics

- Store "us" under the key "edition" (think of it like one big hash table)
- This value is no good as of Wed Feb 18...
- This value should only be readable by any domain ending in `.zdnnet.com`
- This should be available to any resource within a subdirectory of `/`
- Send the cookie to any future requests to `<domain>/<path>`

Discussion Question: Let's say the web-page at <http://cute-puppies.com> looks like the following:

```
<html>
  <body>
    <p>Here is a GIF of puppies</p>
    
    <script type="text/javascript"
      src="http://yahoo.com/analytics.js"></script>
  </body>
</html>
```

Alice uses Mozilla Firefox. In her first browser tab, she has <https://swarthmore.edu> open. In a second tab, she opens <http://cute-puppies.com>. In a third tab, she opens <http://cute-puppies.com> once again. Which entities know that the same person visited [cute-puppies.com](http://cute-puppies.com) twice?

- A. [cute-puppies.com](http://cute-puppies.com) operators B. [yahoo.com](http://yahoo.com) operators C. Mozilla D. Swarthmore

# Browser: Basic Execution Model

Each browser window or frame:

- Loads content
- Renders
  - Processes HTML and executes scripts to display the page
  - May involve images, subframes, etc.
- Responds to events

Events

- User actions: `OnClick`, `OnMouseover`
- Rendering: `OnLoad`, `OnUnload`
- Timing: `setTimeout()`, `clearTimeout()`

# HTML and Scripts

```
<html>
  ...
  <p> The script on this page adds two numbers
  <script>
    var num1, num2, sum
    num1 = prompt("Enter first number")
    num2 = prompt("Enter second number")
    sum = parseInt(num1) + parseInt(num2)
    alert("Sum = " + sum)
  </script>
  ...
</html>
```

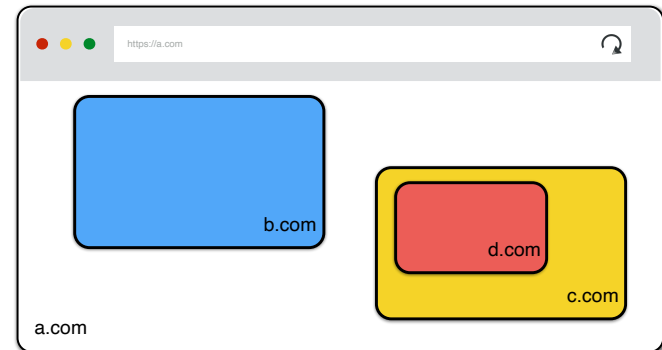

**Browser receives content,  
displays HTML and executes  
scripts**

# (i)Frames

Beyond loading individual resources, websites can also load other *websites* within their window

- Frame: rigid visible division
- iFrame: floating inline frame

Allows delegating screen area to content from another source (e.g., ad)

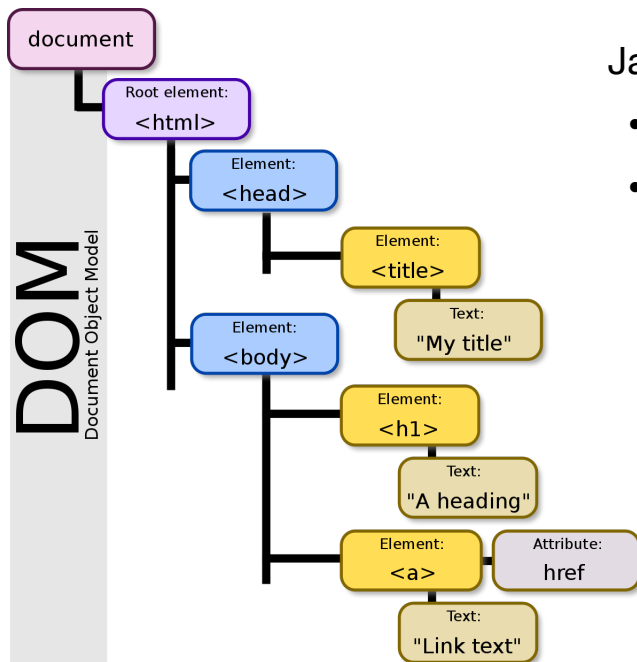

# Event-Driven Script Execution

```
<script type="text/javascript">  
  function whichButton(event) {  
    if (event.button==1) {  
      alert("You clicked the left mouse button!") }  
    else {  
      alert("You clicked the right mouse button!")  
    }  
  }  
</script>  
...  
<body onmousedown="whichButton(event)">  
...  
</body>
```

Script defines a page-specific function

Function gets executed when some event happens

# Document Object Model (DOM)

Javascript can read and modify page by interacting with DOM

- Object Oriented interface for reading/writing page content
- Browser takes HTML -> structured data (DOM)

```
<p id="demo"></p>
```

```
<script>  
  document.getElementById('demo').innerHTML = Date()  
</script>
```

Beware of late-night lane closures on your way to (and from) LAX

Which sections of this page generate cookies? How many third-party cookies?

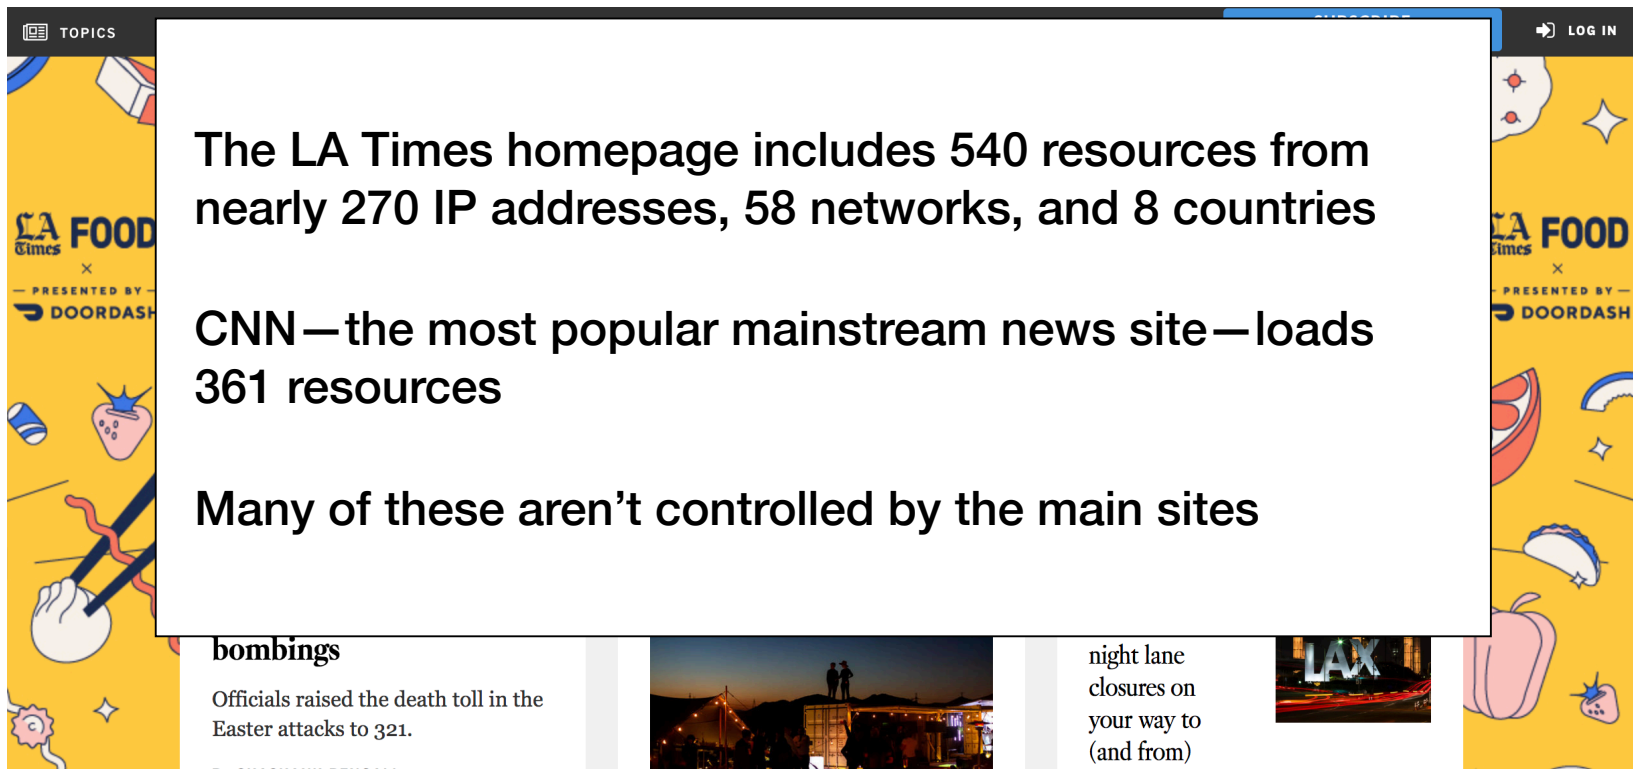

# Modern Website

The image shows a screenshot of the Los Angeles Times website with several callout boxes pointing to specific features:

- Third-party ad:** Points to the 'LA FOOD' banner on the left side of the page.
- Google analytics:** Points to the 'GO UNLIMITED!' banner at the top left.
- Framed ad:** Points to the Casper advertisement in the center of the page.
- jQuery library:** Points to the 'SUBSCRIBE' button in the top right navigation bar.
- Local scripts:** Points to the 'LOG IN' button in the top right navigation bar.

The website content includes a navigation bar with 'TOPICS', 'SEARCH', and various category links (LOCAL, POLITICS, SPORTS, ENTERTAINMENT, OPINION, PLACE AN AD). The main header features the 'Los Angeles Times' logo, the date 'APRIL 23, 2019', and the temperature '62°F'. Below the header is a 'TRENDING TOPICS' section with links for 'SRI LANKA', 'CALIFORNIA NATIONAL GUARD', 'CENSUS', 'DESERT PARTY', 'LUKE WALTON', and 'BEER POWER RANKINGS'. The Casper advertisement includes the text 'I will never leave my bed again. Caryn from California' and a 'Learn more' button.

night lane closures on your way to (and from)

LAX

# Cookies and web authentication

- An extremely common use of cookies is to track users who have already authenticated
- If the user already visited <http://website.com/login.html?user=alice&pass=secret> with the correct password, then the server associates a “session cookie” with the logged-in user’s info
- Subsequent requests (GET and POST) include the cookie in the request headers and/or as one of the fields: <http://website.com/doStuff.html?sid=81asf98as8eak>
- The idea is for the server to be able to say “I am talking to the same browser that authenticated Alice earlier.”

# Web Isolation

## Safely browse the web

Visit a web sites (including malicious ones!) without incurring harm

**Site A** cannot steal data from your device, install malware, access camera, etc.

**Site A** cannot affect session on **Site B** or eavesdrop on **Site B**

## Support secure high-performance web apps

Web-based applications (e.g., Google Meet) should have the same or better security properties as native desktop applications

# Web Security Model

## Subjects

“Origins” — a unique **scheme://domain:port**

## Objects

DOM tree, DOM storage, cookies, javascript namespace, HW permission

## Same Origin Policy (SOP)

**Goal:** Isolate content of different origins

- **Confidentiality:** script on evil.com should not be able to read bank.ch
- **Integrity:** evil.com should not be able to modify the content of bank.ch

# Origins Examples

Origin defined as scheme://domain:port

**All of these are different origins — *cannot* access one another**

- http://swarthmore.edu
- http://**www**.swarthmore.edu
- http://swarthmore.edu:**8080**
- **https**://swarthmore.edu

**These origins are the same — *can* access one another**

- http://swarthmore.edu
- http://swarthmore.edu:80
- http://swarthmore.edu.cs

# Bounding Origins — Windows

Every Window and Frame has an origin

Origins are blocked from accessing other origin's objects

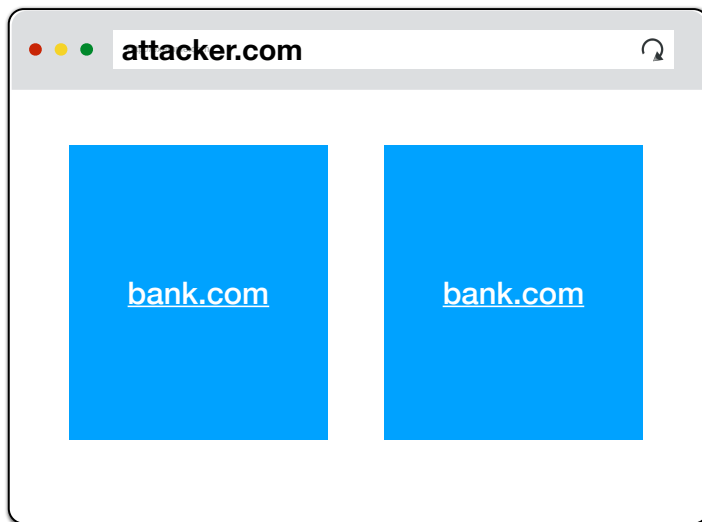

attacker.com cannot...

- *read or write* content from **bank.com** tab
- *read or write* **bank.com**'s *cookies*
- *detect* that the other tab has **bank.com** loaded

# Bounding Origins — Frames

Every Window and Frame has an origin

Origins are blocked from accessing other origin's objects

**attacker.com** cannot...

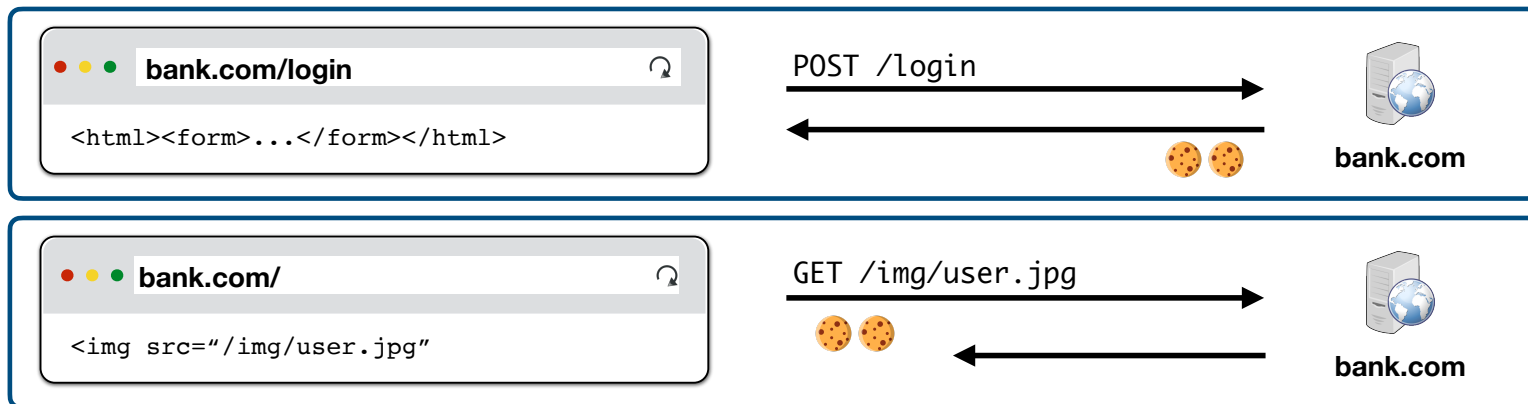

- *read* content from **bank.com** frame
- *access* **bank.com**'s cookies
- *detect* that has **bank.com** loaded

# HTTP Cookies

**Set-Cookie:** <cookie-name>=<cookie-value>

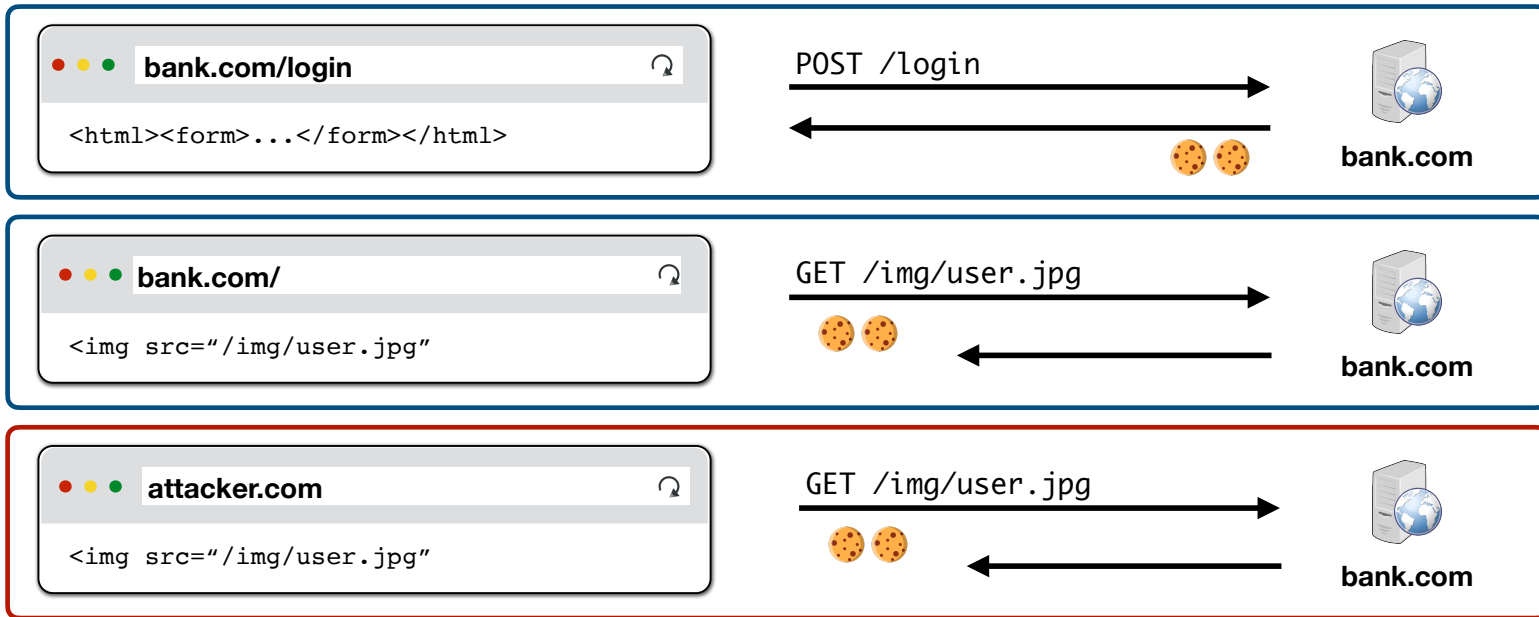

# Cookies

“In scope” cookies are sent based on origin regardless of requester

# Cookies

“In scope” cookies are sent based on origin regardless of requester

# Cookie Same Origin Policy

Cookies use a different definition of origin than the DOM:

**(domain, path): (cs88.swarthmore.edu, /foo/bar)**

A page can set a cookie for its domain or any parent domain (as long as the parent domain is not a public suffix).

Can set a cookie for its path or any parent path.

Browser sends cookies that are in a URL's scope. Cookies that...

belong to domain or parent domain

*AND*

are located at the same path or parent path

DOM definition of an origin:  
(scheme, domain, port)

# Setting Cookie Scope

Websites can set a scope to be any parent of domain and URL path

- ✓ cs88.swarthmore.edu *can* set cookie for cs88.swarthmore.edu
- ✓ cs88.swarthmore.edu *can* set cookie for swarthmore.edu
- ✗ swarthmore.edu *cannot* set cookie for cs88.swarthmore.edu
  
- ✓ website.com/ *can* set cookie for website.com/
- ✓ website.com/login *can* set cookie for website.com/
- ✗ website.com *cannot* set cookie for website.com/login

# Scoping Example

name = cookie1  
value = a  
domain = login.site.com  
path = /

name = cookie2  
value = b  
domain = site.com  
path = /

name = cookie3  
value = c  
domain = site.com  
path = /my/home

**cookie domain is suffix of URL domain  $\wedge$  cookie path is a prefix of URL path**

	Cookie 1	Cookie 2	Cookie 3
<a href="#">checkout.site.com</a>			
<a href="#">login.site.com</a>			
<a href="#">login.site.com/my/home</a>			
<a href="#">site.com/account</a>			

# Scoping Example

name = cookie1  
value = a  
domain = login.site.com  
path = /

name = cookie2  
value = b  
domain = site.com  
path = /

name = cookie3  
value = c  
domain = site.com  
path = /my/home

cookie domain is suffix of URL domain  $\wedge$  cookie path is a prefix of URL path

	Cookie 1	Cookie 2	Cookie 3
<a href="#">checkout.site.com</a>	No	Yes	No
<a href="#">login.site.com</a>	Yes	Yes	No
<a href="#">login.site.com/my/home</a>	Yes	Yes	Yes
<a href="#">site.com/account</a>	No	Yes	No
