CS 31: Intro to Systems
Thread Synchronization

Vasanta Chaganti & Kevin Webb
Swarthmore College
December 5, 2023
Synchronization

• Synchronize: to (arrange events to) happen at same time (or ensure that they don’t)

• Thread synchronization
  – When one thread has to wait for another
  – Events in threads that occur “at the same time”

• Uses of synchronization
  – Prevent race conditions
  – Wait for resources to become available
Synchronization Example

• Coordination required:
  – Threads in different regions must work together to compute new value for boundary cells.
  – Threads might not run at the same speed (depends on the OS scheduler).
    Can’t let one region get too far ahead.
Thread Ordering

(Why threads require care. Humans aren’t good at reasoning about this.)

• As a programmer you have *no idea* when threads will run. The OS schedules them, and the schedule will vary across runs.

• It might decide to context switch from one thread to another *at any time*.

• Your code must be prepared for this!
  – Ask yourself: “Would something bad happen if we context switched here?”
Example: The Credit/Debit Problem

• Say you have $1000 in your bank account
  – You deposit $100
  – You also withdraw $100

• How much should be in your account?

• What if your deposit and withdrawal occur at the same time, at different ATMs?
Credit/Debit Problem: Race Condition

Thread $T_0$

Credit (int a) {
    int b;
    b = ReadBalance ();
    b = b + a;
    WriteBalance (b);
    PrintReceipt (b);
}

Thread $T_1$

Debit (int a) {
    int b;
    b = ReadBalance ();
    b = b - a;
    WriteBalance (b);
    PrintReceipt (b);
}
Credit/Debit Problem: Race Condition

Say $T_0$ runs first
Read $1000$ into $b$

**Thread $T_0$**

Credit (int $a$) {
    int $b$;
    $b$ = ReadBalance ();
    $b$ = $b$ + $a$;
    WriteBalance ($b$);
    PrintReceipt ($b$);
}

**Thread $T_1$**

Debit (int $a$) {
    int $b$;
    $b$ = ReadBalance ();
    $b$ = $b$ - $a$;
    WriteBalance ($b$);
    PrintReceipt ($b$);
}
Credit/Debit Problem: Race Condition

Thread T₀

Credit (int a) {
    int b;

    b = ReadBalance ();
    b = b + a;
    WriteBalance (b);

    PrintReceipt (b);
}

Say T₀ runs first
Read $1000 into b
Switch to T₁
Read $1000 into b
Debit by $100
Write $900

Thread T₁

Debit (int a) {
    int b;

    b = ReadBalance ();
    b = b - a;
    WriteBalance (b);

    PrintReceipt (b);
}
Credit/Debit Problem: Race Condition

Thread $T_0$

Credit (int $a$) {
    int $b$;
    $b = \text{ReadBalance}()$;
    $b = b + a$;
    WriteBalance ($b$);
    PrintReceipt ($b$);
}

Say $T_0$ runs first
Read $1000$ into $b$
Switch to $T_1$
Read $1000$ into $b$
Debit by $100$
Write $900$

Thread $T_1$

Debit (int $a$) {
    int $b$;
    $b = \text{ReadBalance}()$;
    $b = b - a$;
    WriteBalance ($b$);
    PrintReceipt ($b$);
}

Switch back to $T_0$
Read $1000$ into $b$
Credit $100$
Write $1100$

Bank gave you $100$!
What went wrong?
"Critical Section"

Thread \( T_0 \)

Credit (int a) {
    int b;
    b = ReadBalance ();
    b = b + a;
    WriteBalance (b);
    PrintReceipt (b);
}

Thread \( T_1 \)

Debit (int a) {
    int b;
    b = ReadBalance ();
    b = b - a;
    WriteBalance (b);
    PrintReceipt (b);
}

Bank gave you $100!

What went wrong?
To Avoid Race Conditions

1. Identify critical sections

2. Use synchronization to enforce mutual exclusion
   - Only one thread active in a critical section
What Are Critical Sections?

• Sections of code executed by multiple threads
  – Access shared variables, often making local copy
  – Places where order of execution or thread interleaving will affect the outcome

• Must run atomically with respect to each other
  – Atomicity: runs as an entire unit or not at all. Cannot be divided into smaller parts.
Which code region is a critical section?

Thread A
main ()
{
    int a,b;

    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);

    a += 1
    return a;
}

Thread B
main ()
{
    int a,b;

    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);

    a += 1
    return a;
}
Which code region is a critical section?

Thread A

```c
main ()
{
  int a,b;

  a = getShared();
  b = 10;
  a = a + b;
  saveShared(a);

  a += 1
  return a;
}
```

Thread B

```c
main ()
{
  int a,b;

  a = getShared();
  b = 20;
  a = a - b;
  saveShared(a);

  a += 1
  return a;
}
```
Which values might the shared $s$ variable hold after both threads finish?

**Thread A**
```
main()
{ int a,b;
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    return a;
}
```

**Thread B**
```
main()
{ int a,b;
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    return a;
}
```

A. 30  
B. 20 or 30  
C. 20, 30, or 50  
D. Another set of values
If A runs first

Thread A

```c
main ()
{ int a,b;
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    return a;
}
```

Thread B

```c
main ()
{ int a,b;
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    return a;
}
```

shared memory

\[ s = 50; \]
main ()
{ int a,b;
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    return a;
}

main ()
{ int a,b;
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    return a;
}
What about interleaving?

Thread A

```c
main ()
{
    int a,b;
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    return a;
}
```

Thread B

```c
main ()
{
    int a,b;
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    return a;
}
```

shared memory

`s = 40;`
Is there a race condition?

Suppose \texttt{count} is a global variable, multiple threads increment it:
\texttt{count++;}

A. Yes, there’s a race condition (\texttt{count++} is a critical section).
B. No, there’s no race condition (\texttt{count++} is not a critical section).
C. Cannot be determined

How about if compiler implements it as:
\texttt{movq (%rdx), %rax}  // read count value
\texttt{addq $1, %rax}      // modify value
\texttt{movq %rax, (%rdx)}  // write count

How about if compiler implements it as:
\texttt{incq (%rdx)}        // increment value
Four Rules for Mutual Exclusion

1. No two threads can be inside their critical sections at the same time.
2. No thread outside its critical section may prevent others from entering their critical sections.
3. No thread should have to wait forever to enter its critical section. (Starvation)
4. No assumptions can be made about speeds or number of CPU’s.
How to Achieve Mutual Exclusion?

- Surround critical section with entry/exit code
- Entry code should act as a gate
  - If another thread is in critical section, block
  - Otherwise, allow thread to proceed
- Exit code should release other entry gates
Possible Solution: Spin Lock?

shared int lock = OPEN;

T₀
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

T₁
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

- Lock indicates whether any thread is in critical section.

Note: While loop has no body. Keeps checking the condition as quickly as possible until it becomes false. (It “spins”)

Possible Solution: Spin Lock?

shared int lock = OPEN;

T₀
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

T₁
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

• Lock indicates whether any thread is in critical section.
• Is there a problem here?
  – A: Yes, this is broken.
  – B: No, this ought to work.
Possible Solution: Spin Lock?

shared int lock = OPEN;

\[ T_0 \]
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

\[ T_1 \]
while (lock == CLOSED);
lock = CLOSED;
< critical section >
lock = OPEN;

• What if a context switch occurs at this point?
Possible Solution: Take Turns?

shared int turn = T_0;

\[ \begin{align*}
\text{T}_0 & \quad \text{while (turn != T}_0); \\
& \quad \langle \text{critical section} \rangle \\
& \quad \text{turn = T}_1; \\
\text{T}_1 & \quad \text{while (turn != T}_1); \\
& \quad \langle \text{critical section} \rangle \\
& \quad \text{turn = T}_0;
\end{align*} \]

• Alternate which thread can enter critical section
• Is there a problem?
  – A: Yes, this is broken.
  – B: No, this ought to work.
Possible Solution: Take Turns?

shared int turn = T₀;

T₀
while (turn != T₀);
< critical section >
turn = T₁;

T₁
while (turn != T₁);
< critical section >
turn = T₀;

• Rule #2: No thread outside its critical section may prevent others from entering their critical sections.
Possible Solution: State Intention?

shared boolean flag[2] = {FALSE, FALSE};

\[ T_0 \]
flag[T_0] = TRUE;
while (flag[T_1]);
< critical section >
flag[T_0] = FALSE;

\[ T_1 \]
flag[T_1] = TRUE;
while (flag[T_0]);
< critical section >
flag[T_1] = FALSE;

- Each thread states it wants to enter critical section
- Is there a problem?
  - A: Yes, this is broken.
  - B: No, this ought to work.
Possible Solution: State Intention?

shared boolean flag[2] = {FALSE, FALSE};

T₀
flag[T₀] = TRUE;
while (flag[T₀]);
< critical section >
flag[T₀] = FALSE;

T₁
flag[T₁] = TRUE;
while (flag[T₀]);
< critical section >
flag[T₁] = FALSE;

• What if threads context switch between these two lines?
• Rule #3: No thread should have to wait forever to enter its critical section.
Peterson’s Solution

shared int turn;
shared boolean flag[2] = {FALSE, FALSE};

T₀
flag[T₀] = TRUE;
turn = T₁;
while (flag[T₁] && turn==T₁);
< critical section >
flag[T₀] = FALSE;

T₁
flag[T₁] = TRUE;
turn = T₀;
while (flag[T₀] && turn==T₀);
< critical section >
flag[T₁] = FALSE;

• If there is competition, take turns; otherwise, enter
• Is there a problem?
  • A: Yes, this is broken.
  • B: No, this ought to work.
Spinlocks are Wasteful

• If a thread is spinning on a lock, it’s using the CPU without making progress.
  – Single-core system, prevents lock holder from executing.
  – Multi-core system, waste core time when something else could be running.

• Ideal: thread can’t enter critical section? Schedule something else. Consider it *blocked*. 
Atomicity

• How do we get away from having to know about all other interested threads?

• The implementation of acquiring/releasing critical section must be atomic.
  – An atomic operation is one which executes as though it could not be interrupted
  – Code that executes “all or nothing”

• How do we make them atomic?
  – Atomic instructions (e.g., test-and-set, compare-and-swap)
  – Allows us to build “semaphore” OS abstraction
Semaphores

• Semaphore: OS synchronization variable
  – Has integer value
  – List of waiting threads
• Works like a gate
• If sem > 0, gate is open
  – Value equals number of threads that can enter
• Else, gate is closed
  – Possibly with waiting threads
Semaphores

• Associated with each semaphore is a queue of waiting threads
• When wait() is called by a thread:
  – If semaphore is open, thread continues
  – If semaphore is closed, thread blocks on queue
• Then signal() opens the semaphore:
  – If a thread is waiting on the queue, the thread is unblocked
  – If no threads are waiting on the queue, the signal is remembered for the next thread
Semaphore Operations

sem s = n;    // declare and initialize

wait (sem s)   // Executes atomically(*)
    decrement s;
    if s < 0, block thread (and associate with s);

signal (sem s) // Executes atomically(*)
    increment s;
    if blocked threads, unblock (any) one of them;

(*) With help from special hardware instructions.
Semaphore Operations

sem s = n;  // declare and initialize

wait (sem s)  // Executes atomically
decrement s;
if s < 0, block thread (and associate with s);

signal (sem s)  // Executes atomically
increment s;
if blocked threads, unblock (any) one of them;

Based on what you know about semaphores, should a process be able to check beforehand whether wait(s) will cause it to block?

A. Yes, it should be able to check.
B. No, it should not be able to check.
Semaphore Operations

```c
sem s = n;   // declare and initialize

wait (sem s)
    decrement s;
    if s < 0, block thread (and associate with s);

signal (sem s)
    increment s;
    if blocked threads, unblock (any) one of them;
```

- No other operations allowed
- In particular, semaphore’s value can’t be tested!
  - No thread can tell the value of s
Mutual Exclusion with Semaphores

sem mutex = 1;

T₀
wait (mutex);
< critical section >
signal (mutex);

T₁
wait (mutex);
< critical section >
signal (mutex);

• Use a “mutex” semaphore initialized to 1
• Only one thread can enter critical section
• Simple, works for any number of threads
• Is there any busy-waiting?
Locking Abstraction

• One way to implement critical sections is to “lock the door” on the way in, and unlock it again on the way out
  – Typically exports “nicer” interface for semaphores in user space

• A lock is an object in memory providing two operations
  – acquire()/lock(): before entering the critical section
  – release()/unlock(): after leaving a critical section

• Threads pair calls to acquire() and release()
  – Between acquire()/release(), the thread holds the lock
  – acquire() does not return until any previous holder releases
  – What can happen if the calls are not paired?
Using Locks

Thread A

```c
main ()
{ int a,b;

   a = getShared();
   b = 10;
   a = a + b;
   saveShared(a);

   return a;
}
```

Thread B

```c
main ()
{ int a,b;

   a = getShared();
   b = 20;
   a = a - b;
   saveShared(a);

   return a;
}
```

shared memory

`s = 40;`
Using Locks

Thread A

```c
main ()
{
    int a,b;

    acquire(l);
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    release(l);

    return a;
}
```

Thread B

```c
main ()
{
    int a,b;

    acquire(l);
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    release(l);

    return a;
}
```

shared memory

```
s = 40;
Lock l;
Held by: Nobody
```
Using Locks

Thread A

```plaintext
main ()
{
    int a,b;

    acquire(l);
    a = getShared();
    b = 10;
    a = a + b;
    saveShared(a);
    release(l);

    return a;
}
```

Thread B

```plaintext
main ()
{
    int a,b;

    acquire(l);
    a = getShared();
    b = 20;
    a = a - b;
    saveShared(a);
    release(l);

    return a;
}
```

shared memory

s = 40;
Lock 1;

    release(l);

    return a;
}
```

shared memory

```
s = 30;
```

Lock 1

Held by: Thread B
Using Locks

- No matter how we order threads or when we context switch, result will always be 30, like we expected (and probably wanted).
Summary

• We have no idea when OS will schedule or context switch our threads.
  – Code must be prepared, tough to reason about.

• Threads often must synchronize
  – To safely communicate / transfer data, without races

• Synchronization primitives help programmers
  – Kernel-level semaphores: limit # of threads that can do something, provides atomicity
  – User-level locks: built upon semaphore, provides mutual exclusion (usually part of thread library)
