

Your project title

Your name(s)

April 28, 2015

1 Introduction

Your paper should be 4-6 pages long. In this section you should give a broad introduction to your project. Assume that you are writing to an audience that is familiar with AI, but may not know the details of the particular techniques that you are using. You should give an overview of the approach being explored, and how you have applied it to a particular problem.

2 Method and Details

In this section you should explain how you implemented your project. You should provide all of the parameter settings used (such as the learning rate, etc.). If you are using a learning algorithm, you should provide details about how long it was trained, and how you determined when to end training.

Details about how to actually test and run your code should not be given in the paper, but should instead be described in the README file in the lab directory.

3 Results

In this section you should show and analyze the results. Use tables and figures when appropriate. If you can't fit all of the pictures that you want to show in the paper you can make an accompanying web site and point the reader to it.

Even if your project was not as successful as you'd hoped, you still need to show results. This is one of the key sections of any scientific paper. Be sure to provide adequate information so that the reader can evaluate the outcomes.

4 Conclusions

This section can be relatively short. It should sum up what you did and what you found.
